

# Challenges of future land use in Europe

- climate change, quality of life and role of rural areas

apl. Prof. Dr.-Ing. Thomas Weith

University of Potsdam, and

Leibniz Centre for Agricultural Landscape Research Müncheberg e.V. (ZALF)

# Outline

- › Land use change in Europe
- › Impacts of land use demands
- › Current discussions
- › Future options

# Land use change in Europe 1

- › Drivers for land use change
  - › Social
    - › migration
    - › demographic change
  - › Economical
    - › concentration of economic activities (metropolitan areas ...)
    - › corresponding infrastructural development
  - › Ecological
    - › change of environmental conditions (esp. impacts of climate change)
      - › for cultivation (agriculture, forestry)
      - › for human wellbeing (heat, floodings)

## Land use change in Europe 2

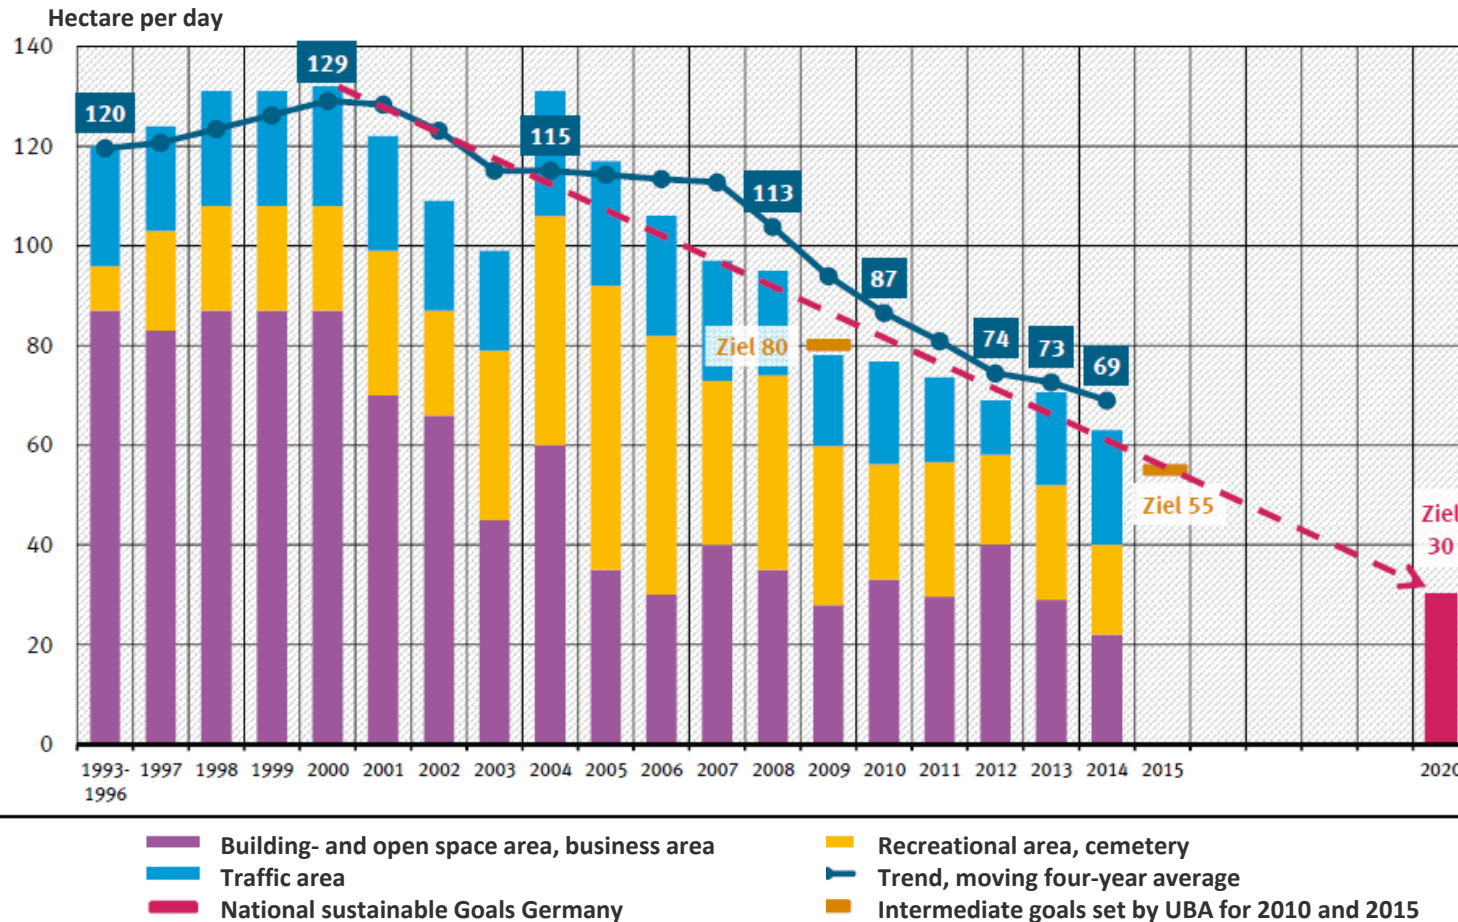

- Human demands on land increased over the last decades
- Growth of sub-urban and peri-urban areas due to
  - increasing demand for
    - living space (single family home)
    - change in household structures (smaller households)
    - production (industry) and logistics
    - infrastructure
  - improved accessibility
- Steady increase of residential and traffic areas amounting to 70 hectare per day in Germany
- One result is an ever-increasing fragmentation of natural habitats

# Land use change in Europe 3

## Increase of residential and traffic areas

## Land use change in Europe 4

- › Land use change is also pushed by political decisions
  - › Energy transition lead to higher land prices due to
    - › increase in cultivation of energy plants and the corresponding (biogas) plants
    - › increase in photovoltaic power plants and wind power plants (on farm land)
    - › the corresponding infrastructure (e.g. power lines)
    - › pushed by capital investments and intensive agriculture
- › Local politicians in regions with uncertain future development perspectives try to reverse the trends by
  - › developing commercial and industrial areas a.w.a. residential areas which further results in
  - › areas for compensation

## Impacts of land use demands

- Increase in conflicts regarding different land use demands
  - between different kinds of land use:  
e.g. agriculture vs. residential areas  
and infrastructure
  
- Increase in conflicts regarding different land use demands
  - within the same kind of land use:  
e.g. different agricultural foci  
(energy crops vs. food crops)
  
- General cohesion vs. regional differentiation

## Current discussions 1

- › The potential of abandoned areas
  - › Most of the challenges related to land use change are well known
  - › Reducing the "artificial use" of land is on the agenda since the 1960s
  - › For years studies point out the high potential of convertible or re-usable areas / brownfields
    - › e.g. Germany (2012): 120.000 – 180.000 ha re-usable areas
  - › The impacts of current trends like re-urbanisation are not assessable to date

## Current discussions 2

- The currently existing legal and planning instruments are mainly too weak to induce or avert substantial changes (with exceptions)
- Neither legal instruments nor rural or urban subsidies policies led to a trend reversal to date (growth policies)
- New developments like the energy transition scheme are often implemented without discussing impacts on land use or spatial and settlement structures

## Current discussions 3

- An improved coordination of the usage of legal and planning instruments, e.g. across spatial levels, is necessary
- New regulations should integrate follow-up costs (planning of settlement areas)
- More approaches to integrate planning information and knowledge management should be used (improving the awareness of actor groups and using ex ante impact assessment)

## Future options 1

- Use existing approaches in rural development !
  
- Less development of residential and traffic areas on valuable (agricultural) land is paramount
  - Need for regional solutions
    - integrating new demands for flood control
    - combining “pooling” and new approaches (intelligent greening)
    - using synergies of different land use demands (e.g. agriculture and leisure)

## Future options 2

- Participation and knowledge integration is the key to acceptance  
(despite the high number of stakeholders and interests)

Projects

Welcome to the knowledge library „Sustainable Land Management“! The knowledge library allows you access to the research and practice products from 25 collaborative projects (module A and B of the funding measure). The knowledge library on the one hand you can search for a specific term or otherwise explore on the category-based search. The category-based search not only gives you an overview of the different topics in the Sustainable Land Management also enables the indexed-sequential output of search results.

Dear users,

please note that the knowledge library is still under construction and thus there are no contents available at this point. Please visit the knowledge library again shortly. It'll be worth it!

## Future options 4

- Integration of urban-rural interrelations (people / brains, cash flows, energy flows)
- Peripherality as a key issue – in urban and rural areas
- Integration of resilience as a conceptual approach
- Implementation of *Land* and *Space* as key issues / concepts in European political activities

## Future options 5

- New impulses from the Sustainable Development Goals (United Nations)
  - Lead to new discussions on e.g.
    - sustainable urban development
    - sustainable agriculture and food security
  
- Intensive discussions are caused by
  - increase in value of farmland
  - changes in land ownership
